CHOOSING HORIZONTAL OR VERTICAL SLATWALL

Do you know when to select horizontal slatwall vs vertical or crossgrooved slatwall? Here are some guidelines:

Choose **HORIZONTAL** slatwall to minimize your visible seams. Lining up 4' of grooves is easier than lining up 8' of grooves. Select horizontal slatwall for ease of installation. The panels are not quite as flexible as vertical panels so they are easier to install. Horizontal panels can be stacked one on top of another so the half grooves on the top and bottom edges join to create a seam. For a long run of slatwall, select horizontal panels. They are more cost-effective than vertical panels since vertical panels carry an additional cost.

Choose **VERTICAL, CROSSGROOVED** slatwall if needing to cover a very narrow but tall area. It is also a good choice for wrapping columns. Trade show booths often use vertical slatwall because the booths are often 8' tall and need a solid panel that is not pieced together.
